

Managed Email Security

Defending Inboxes from Ransomware, Phishing, and Data Loss

Is your email welcoming attackers?

The protection of your organizations email is a high priority when it comes to defending your user base and confidential data. Email has become a mission critical tool that's being abused by attackers to compromise networks and steal data. The number one attack method today starts with phishing links sent through email and having a solution to protect against these attacks is imperative. Attackers continually use phishing as a first step in compromising users to spread malware and ransomware, steal data, and exploit vulnerabilities on the user's endpoint.

There are also additional threats enterprises need to protect their email from outside of malware and phishing. These include data loss of sensitive information, risky attachments, imposter emails, and malicious links. The widespread use and dependence on email has made it a direct target for attacker to exploit and since most users have an email address it's an easy first step to try and exploit. Due to these risks the need for managed email security is in high demand.

Many regulations are now calling for email encryption, archiving, and the protection of sensitive data (DLP) leaving your network. Our managed email security solution assists with meeting these compliance requirements as well as the ability to meet standards that call for 10 year email archiving and eDiscovery needs.

With our managed email security offering CCSI is able to manage these services for your enterprise to give you the best possible chance in defending against threats directed at your organizations emails. This solution is fully managed and comes complete with our 24x7 SOC to assist with customizing our offering to your particular business needs. This includes the fine tuning, monitoring, implementation, and day-to-day management to secure your email.
